Automated System for RE Consignments

A collaborative effort to promote the automation of simplified customs procedures for expeditious facilitation of humanitarian imports during an emergency

In December 2013, OCHA and UNCTAD signed an MoU agreeing to enhance the cooperation in promoting the automation of simplified customs procedures for expeditious facilitation of humanitarian imports during an emergency. Key to this was developing an ASYCUDA module for Relief Emergency Consignments, which will automate the control and monitoring of relief consignments.

As such the ASYREC module would appear only in circumstances where there has been a decree/request for international assistance and/or when there are already specialized or ad-hoc customs facilitation measures in place. The ASYREC module would appear with simplified paperwork, streamlined inspection criteria for selected items, from selected senders.

**Added value**

- Facilitate the implementation of regulatory requirements for cross-border movement of goods
- Provide transport operators with a single interface for receiving information and submission of all required documents
- Streamline inter-agencies processes and controls
- Improve interoperability between Customs and other governmental organisations
- Design common electronic solutions for supporting documents (e-certificates, e-licenses, permits, authorizations)
- Take on board international recommendations and best practices
- Ensuring faster goods processing, more predictability and transparency, fewer delays and uncertainty, lower barriers at the border

How it works? how it was developed? what are the main features of ASYREC?

UNCTAD – ASYCUDA team will answer all your questions. Come and join the session.
