Release note LogIE 2.4.16

31 August 2023

1. New features

The following new features have been released. Please note that many functions are activated for a specific operational context and might only be visible for some operations.

New visualisation of the Concept of Operations:

The Concept of Operations now has a new way of showing the information that:

1. Better resembles the CONOPS static maps from Logistics Cluster
2. Combines all Logistics Cluster services per location to improve readability

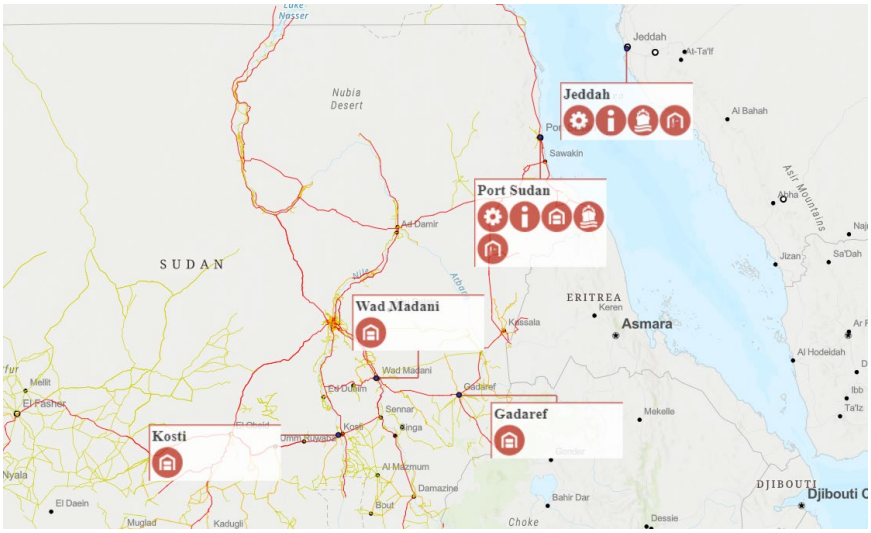

Figure 1. Example of the new CONOPS visualisation on LogIE. Visit the operation´s page for up-to-date information.

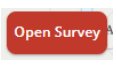
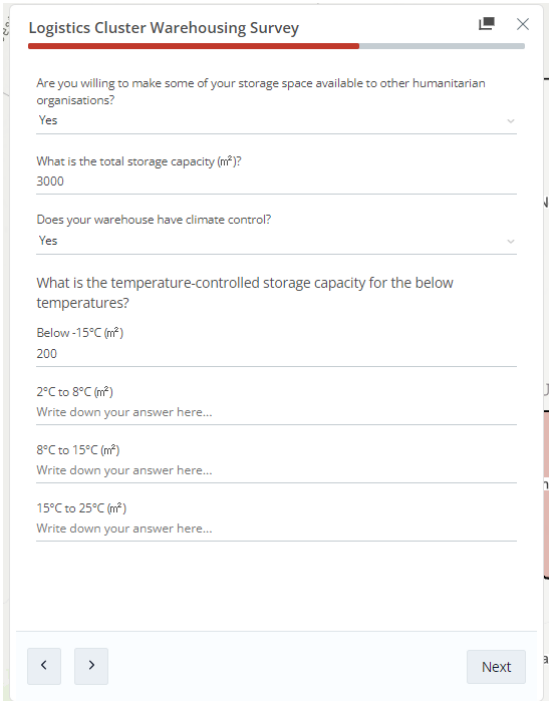
A new rapid data collection form for Logistics Cluster warehousing information:

Partners can directly share their storage capacity for humanitarian usage on LogIE:

1. An interactive form that is easy to use and fast to fill out.
2. Supports multi-language
3. If activated, users' contact details are remembered in the browser to save time and effort when creating multiple reports.
4. The form can be opened by clicking on the button “Open Survey”





2. Improvements and addressed issues

- **Improved info boxes** that highlight important information on the map. In previous versions, the text box appeared on top of the icons, now it appears next to the icons. It also allows moving the boxes on the map (drag & drop) for better readability. *Please note that this change is only stored in the user's browser, hence is only visible for the individual user.*

- **Improved algorithm to aggregate information at administrative levels.** LogIE aggregates some information at the administrative level, like the storage capacity of Logistics Cluster Partners for a specific region. The algorithm has been improved to run faster and automatically in the background for a specified update frequency.
- **Focus effect on the country of interest.** New functionality has been added to improve the user experience of LogIE. Surrounding countries will appear in grey.

- **More locations on the map. Improved location names on the** map. The base map has been improved, so when zooming in, more locations appear gradually on the map without making the map overcrowded with location names.
- The **editor widget** has been improved for better usability. Further improvements will come in the next release.
- Loading performance has been further improved.

3. Known issues and limitations

The following issues have been identified and are part of the current development roadmap to be addressed in the upcoming releases.

- Map export is limited to public layers. An improved mapping version is under development.
- Comment fields are shown in all available languages. If information is entered in multiple languages, you see both languages in parallel. Full multilingual handling of layer content is under development.

We are always happy to improve! Please send us an email to global.logie@wfp.org in case you want to share any ideas, suggestions, or identified issues. Thank you!
